Project Title: Serverless Portfolio Hosting

Broad Area: Cloud Computing

Type of Project (Application,Model,Design,Prototype Type): Prototype

Objective: To deploy a highly available, cost-effective, and secure web application using serverless cloud technologies, demonstrating foundational cloud infrastructure management without the need to provision virtual machines.

Brief description: This project involves developing a static portfolio web application and hosting it entirely on the cloud. It leverages Amazon Simple Storage Service (S3) for static website hosting and Amazon CloudFront (CDN) to ensure low latency and global availability. The system is designed to eliminate the overhead of traditional server administration, focusing purely on serverless deployment, identity access management (AWS IAM), and cost-efficient cloud storage.

Software Requirements

Programming Language: JavaScript, HTML, CSS

Tools: AWS S3, AWS CloudFront, AWS IAM

Hardware Requirements

Processor: Intel Core i3

Memory: 4 GB RAM or above

Any other devices: Internet connection; smartphone/PC for accessing the application
